

DEXIS

An End-to-End Digital Imaging Workflow

Two award-winning solutions from DEXIS offer expert diagnoses and efficient treatment planning

A quick glance at today's dental landscape leads to an unmistakable conclusion: it's filled to the brim with digital products, many of which are incompatible with a practice's existing workflow—or even each other. DEXIS cuts through the confusion from start to finish with a portfolio of easy-to-use, award-winning imaging solutions powered by assisted intelligence (AI). Working seamlessly together, DEXIS digital solutions, such as DPS Best Products ORTHOPANTOMOGRAPH OP 3D and NOMAD Pro 2, provide tools for expert diagnoses and enhanced patient treatments.

Versatile Imaging Programs

The DEXIS OP 3D is a complete x-ray platform with an intuitive user interface, versatile imaging programs, and an easy patient positioning system.

"The OP 3D provided a great service to our patients because rather than sending them out to another office for a CBCT, we can now discuss at the implant consultation if they are a good candidate for an implant," explained Adam Beno, DMD, Fort Myers, FL, who also uses the OP 3D to take all panoramic and extraoral x-rays.

OP 3D features 4 resolutions for 3D as well as for metal artifact reduction, along with 4 predefined volumes, all of which are freely positionable and height adjustable, for a possible 36 FOV sizes.

"We can take a scan of a single tooth area for endodontics or a single tooth implant, all the way up to visualizing

the entire maxillofacial area," Dr. Beno added. "The quality is exceptional and it's simple to export the image files."

Ergonomic & Portable

Also deemed a DPS Best Product, the NOMAD Pro 2 is an ergonomic, lightweight, and portable x-ray unit that offers sharp, repeatable radiographic images, along with a high-capacity battery. A unique acrylic shield protects against scatter radiation and a proprietary housing blocks radiation leakage.

"Everyone loves flexibility and quality!" said Aamna Nayyar, BSc, BDS, GPR, DDS, in Rio Rancho, NM. "NOMAD Pro 2 gave us the freedom to take x-rays in areas where wall-mounted machines would not help—we can easily take it to clinic sites and health fairs!"*

See Multiple Scans and Images—All on One Screen

DEXIS connects its entire line of imaging equipment with DTX Studio Clinic, an AI software that brings 2D, 3D, intraoral scans, and images together on one user-friendly platform, streamlining patient data from multiple sources and making it accessible on one screen. The result? More confident diagnoses, efficient treatment planning, and successful treatment outcomes.
